Subject: Zilog eZ80 bits and pieces

I've just got my hands on an eZ80 Acclaim! development kit (the EZ80F910200ZCO) and managed to get it working with a copy of the Zilog ZDS II 5.3.0 development tools running on Windows 7 under Oracle VirtualBox on my Mac mini.

Looking around the 'net I can find a few bits and pieces - including a version of CP/M 2.2 that uses the SPI interface to hookup an SD card as storage.

I also found references to Howard Harte's ez80sbc (which uses the eZ80F91 module plugged in to his own designed board). Is there anyone here with such a beast? The archive.org wayback machine has the now non-existent site www.ez80sbc.com with a download link to a ez80sbc_Setup.msi file that (of course) wasn't archived. This (presumably) has a CP/M plus implementation as a ZDS project that I'd like to have a look at.

Also, any other pointers to useful eZ80 stuff would be appreciated.

Thanks

Tony
