Hi,
sometimes I'm tempted to use an eZ80 too... but for now I haven't done it because IMHO the chip
is too much overpriced and not easy to find... I mean for the same price I can buy a Cyclone II
FPGA that is a lot more fun to use and study... (I don't know if some eZ80 flavor is still in
production...).

I've done in the past some research... give a look here if there is something interesting for you...

BTW: this thread could be a place to share information about it... (never say never...).

Best regards.
