So KIO is too late & too expensive as a highly integrated replacement of the earlier Z80 systems. At least it is still available today and a possible candidate for the full-features, fast Z80 new designs. In my short (2 years) exposure to the world of Zx80, I have the feeling that there are greater and greater interests in Zx80 and more people are exploring different ways of using Z80 & its peripherals. Maybe I'm imaging it, but Retro is now cool?

Bill

PS, Nay! it is the 1/2 bottle of Cabernet Franc talking...
