If you are paranoid also try copying some worst case patterns in files (FF FF 00 00 repeated for 16bit and FF 00 FF 00 for 8bit) but it should find anything.

You should be able to use up to a 128GB card with most systems, above that needs LBA48 addressing which I've not seen supported by a CP/M BIOS. You'd still be able to access the lower 128GB but after that it'll silently wrap and corrupt.
