I met Dave at VCFMW, and he gave me the PCB for his FP6120DTR front panel that he had running on his stand. I haven't built it yet, but it looks really nice.

Dave's also responsible for the Retro Elf Project, a much-expanded RCA1802 system complete with front panel, large flash storage and multiple serial ports. It can also do the 1802's party trick of running the CPU at glacial speeds: at 3 Hz, you can read along and disassemble instructions in your head from the front panel LEDs.
